

Genius' Garden Foundation is committed within the next 5 years to build these 9 academies, and not only develop altruistic intelligence and creative genius but also make it shine!

These structures will allow for more in-depth identification of selected members who may, after a period of evaluation and adaptation within one of the eight academies, continue their personalised academic career and in parallel, undertake and develop their personal projects.

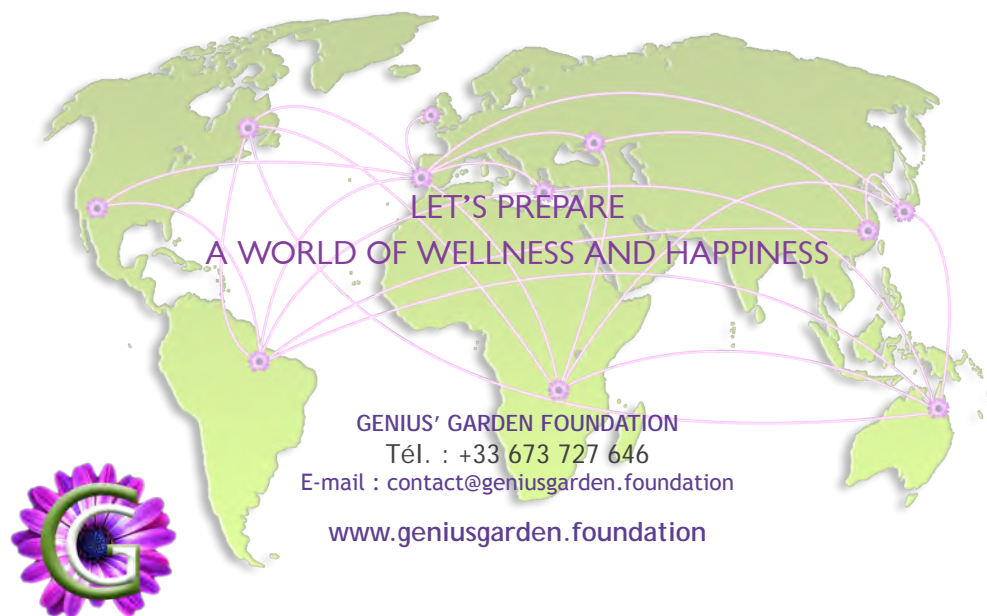

During their journey, they will be accompanied by talented teachers and speakers from outside, specialised in their projects. With them, they will be able to develop their skills, their creativity, their judgement and their entrepreneurial abilities.

These geniuses will also be called to meet regularly to exchange their observations on the various political, economic, social and other situations, that reflect the international climate and landscape. Following these periodic exchanges, they will be asked to publish their solutions as guide-ways with a view to increase the level of social happiness.

This social activity will have to gain a reputation quickly, in order to become a voice of essential guidance, as well as a reference in our society for the local, provincial, continental and even global political arenas.

Once these first 9 basic academies are established, it will then be easy to implement similar academies in further countries adapted to the location and culture of the chosen site.

As the number of Genius' Garden Foundation academies increase, so will the knowledge, generated by their participants, which can then be applied as solutions straight away.

CREATION OF A GLOBAL ACADEMY OF GIFTED AND GENIUSES

GOAL OF GENIUS' GARDEN FOUNDATION

Our 21st century society faces huge new planetary challenges in all areas:

- Energy
- Ecology
- Agriculture
- Town planning
- Demography
- Monetary systems
- Health, basic and molecular sciences
- Development of neo-technologies: computer science, robotics, nanotechnology
- Research on well-being and personal and collective growth through education, the arts ...

Extraordinary times require extraordinary solutions, and to survive these challenges we will need the help of those with exceptional talents, that is to say the geniuses, whose level of intelligence and creativity far exceeds the common average. To meet this inevitable need, Genius' Garden Foundation is launching an intercontinental project to create 9 academies, 150 school groups, a MOOCs diffusion site and 10 international research centre, which will host a population of students and researchers recognised by academic institutions as gifted creative people commonly called "Geniuses".

Trained in new sciences and humanitarianism, these students, doctoral students and researchers will be excellent guides for the challenges mentioned above. They will be able to influence and promote policies for peace in the world as well as the development of well-being for all humanity in the interest of justice and prosperity.

The funding of Genius' Garden Foundation will come from donations from international sponsors.

VISION OF GENIUS' GARDEN FOUNDATION

To survive tomorrow's challenges, humanity needs creative intelligence balanced with ecological and humanitarian values. To remain sustainable, a civilisation needs not only to provide material and social prosperity, but also to make place for wisdom and human genius.

Why not give those creative and inventive geniuses, whose motivations are based on beautiful humanitarian values, the chance to think and shape a more humane and modern society, free from the archaic constraints holding us back?

Genius' Garden Foundation aims to provide creative, gifted people around the world, with the means to develop and refine their talents which they can then use to benefit humanity, by solving the major problems of today's world.

These projects will aim to:

- Place human well-being at the forefront of everything.
- Pull humanity into the 4th industrial age: that is to say, free humans from forced labour through the development of computer science, agronomy, nano-robotics and new energies.
- Initiate research and applications in the field of traveling from carrier waves;
- Develop artificial intelligence and its positive prospects for a beneficial use;
- Redistribute the benefits of robotised production equitably and intelligently.
- Preserve the environment from any form of pollution including the pollution of harmful electromagnetic radiations.
- Develop the principles of biomimicry (materials and systems modelled on biological processes).
- Introduce art into everyone's lives and their environment, so as to inspire creative freedom and an artistic culture.
- Produce and distribute local fresh and natural food with modern technologies around the globe.
- Establish an international electronic currency that will be the prelude to the disappearance of monetary transactions and finally of all money itself.
- Regulate the rampant demographic problems that put us in danger, by creating an innovative, attractive and empowering urbanism.
- Design policies with the essential ethos of love and compassion.
- Create a social climate of happiness through the implementation of the Declaration of Universal Human Rights.
- Open the way to the individual fulfilment and that of the society as a whole.

GENIUS' GARDEN FOUNDATION TO STIMULATE THE TALENTS OF GENIUSES

To achieve maximum benefit, society needs to channel the creativity of these gifted people so as to respond to the changing needs of humanity. For this, our team is gathering the means to develop two fundamental instruments:

- A world academy of creative geniuses and inventors, composed of one academic university city per continent, totalling 9 globally, welcoming altruistic potential creative geniuses of all ages from pupils, students, PhD students to researchers and offering them not only training and development, but also a synergistic meeting point both physical locally and virtual globally.
- An international collegial organisation of humanitarian guidance that may be called "Organisation of Earth Geniuses" to help people to understand and adapt to the new political, economic and social orientations .. and present more favourable future alternatives and solutions.

The 9 academies set up by Genius' Garden Foundation, will be small towns on a human scale, and welcome the creative gifted people for the time needed to complete their projects. The academies will offer the infrastructure to enable them to freely engage in their creative passions, all in an optimal environment that meets their needs and desires.

These 9 towns will serve as study and practical working areas, providing knowledge, skills and certification. Indeed, by participating in the creation of the soul of the city, students and researchers will find a privileged field of experimentation. Thanks to the requested financial funds, Genius' Garden Foundation will also offer the tools to weave and develop a web of knowledge and give humanity the means to respond to its most subtle of needs.

150 school groups will be spread throughout the world under the authority of the continental academy related thereto. They will be pedagogical spaces welcoming students from primary to secondary or even terminal, a high potential detection center and a gateway for candidates to academies.

IT, the internet, MOOCs (Massive Open Online Courses) and the relational network of the foundation will be some of the valuable tools allowing the students of Genius' Garden Foundation to share, exchange and transmit their knowledge and applications to the other universities around the world.
